

RUBIC

Hybrid production systems based on safe human-robot interactive cooperation EUROPEAN MANUFACTURING

Innovation Activity

MANUFACTURING CHALLENGES

1

Automation and digital transformation of existing manufacturing processes.

Quality assessment operations require high repeatability, accuracy and precision.

SOCIETAL CHALLENGE

2

Quality assessment operations are performed manually – Hard to automate.

They are non-ergonomic operations leading to many errors and causing injuries to the operators.

3

PROJECT OBJECTIVE

RUBIC aspires to implement a hybrid working cell in order to automate the quality testing actions of a part.

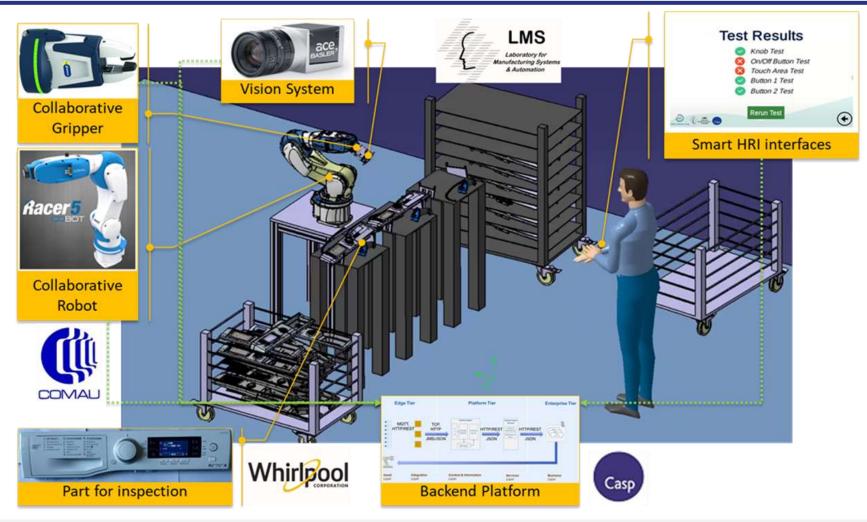

Those activities are performed on a station where the robot precision and repeatability are combined with the cognition capabilities of human.

RUBIC - Proposed Solution

1

RUBIC – Expected Benefits

2 MANUFACTURING BENEFITS **SOCIETAL BENEFITS OTHER BENEFITS** Increase automation and Improve working conditions digital transformation of a for operators by automating traditionally manual part of their activities. manufacturing process. Avoid repeatable operations, Improve quality assessment leaving only the cognitive operations, avoiding quality ones. detection failures and by logging test results for all Minimize injuries and stress. products.

- Provided opportunity to collaborate with big European industries
- Offered possibility to address a real industrial problem
- Created the conditions to implement, test and validate an hybrid solution
- Enhance the portfolio of technical partners with a new solution, ready for market

RUBIC – Results and next steps

- Setup RUBIC demonstrator in industrial environment
- Validate RUBIC solution
- Package the final cell into a commercial product
